**Populism and the attitude towards the EU, 2017: Slovenia**

ADP-IDNo: POPEU17

DOI: [https://doi.org/10.17898/ADP\\_POPEU17\\_V1](https://doi.org/10.17898/ADP_POPEU17_V1)

**CEU Analysis Hungary**

## Introduction

This report analyses the results of the survey on citizens' attitudes towards the EU, towards democratic values and civil rights and their perceptions about the most important challenges the EU face.

The structure of the document is the following. First, each question is discussed separately in the same format: 1, a graph showing frequencies<sup>12</sup>; 2, a table (presented in the Appendix) illustrating relative frequencies across different demographic characteristics<sup>3</sup> complemented by the results of chi-square tests,<sup>4</sup> to analyze the existence of a relationship between the demographic characteristics and the question one by one; 3, and a graph showing the effects of demographic variables on the given question (from 2 to 10)<sup>5</sup> are shown. In case of Questions 4, 5, 6, 7 and 10 the structure is partly different as they all contain multiple sub-questions. In their case, frequencies are shown separately, distributions across demographic groups are shown in separate tables, while the effects of demographic variables are shown in multiple graphs. Second, the main results are briefly discussed in the conclusion.

---

<sup>1</sup> When presenting the relative frequencies “do not know/no answer” option is also calculated in 100% at this part of the analysis. So the frequencies of the other answer options show the number of those who selected that answer divided by all respondents, and not the number of those who selected that answer divided by only those respondents who gave a substantial answer to the given question.

<sup>2</sup> Weights are used for all analyses.

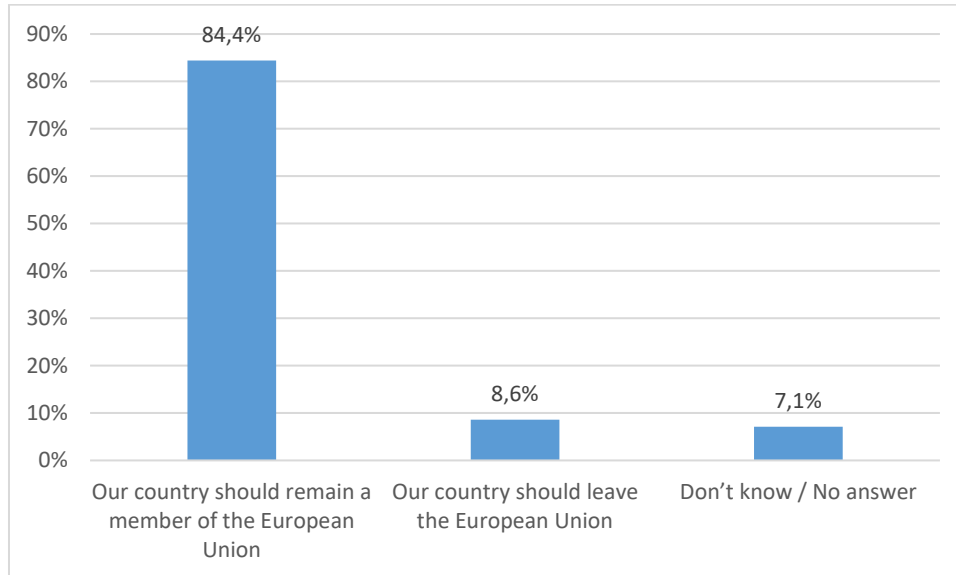

<sup>3</sup> Tables show the distributions across the asked demographic groups. In case of questions 4,5,6,7,10 tables are shown separately for each sub-question, the order of the sub-questions comes from the survey and from the data file. Regarding the demographic variables, the distributions for “do not know” and “no answer” categories are not presented in the tables for the variable on work, but were computed as well.

<sup>4</sup> Chi-square tests show whether there is an association (in the underlying population) between a demographic variable and the given question. In this case we want to see whether the distributions of the answers to the given question differ across demographic characteristics. These tests are done separately between each demographic characteristic and the given question. These tests are done for each question, and only the statistically significant relationships (where we can reject the null hypothesis that there is no difference in the distributions of the given question in the underlying population across the given demographic characteristics) are shown – the p-value threshold is set to be at 0.05. Chi-square tests do not say anything about the direction of the relationship, for that matter a logistic regression may be done for Question 1 and linear regressions for Questions 2-10 – see the next note.

<sup>5</sup> For Questions 2-10 separate linear regressions are done where the given question is the dependent variable and the demographic variables (gender, age, education, work, region, place of living, party preference) are the independent variables. These analyses are needed because *a*, chi-square tests only show whether there is a relationship between the given question and the demographic variables without the direction of the relationship; *b*, they make it also possible to control for the effects of all the other demographic variables at the same time. Regarding the dependent variables, recodings were done: 0-2 (too negative-correct-too positive) for Question 2; 0-3 (totally disagree-rather disagree-rather agree-totally agree) for Questions 3, 4, 5, 8, 9; 0-3 (very negative role-rather negative role-rather positive role-totally positive role) for Questions 6, 7; and 0-3 (not important at all-rather not important-rather important-very important) for Question 10. “Do not know/no answer” answers are regarded as missing values in this analysis. These variables are regarded as continuous. Question 1 is dichotomous, thus this type of analysis is not done there. Regarding the independent variables, age is used in continuous form, while for work and party preference, “do not know” and “no answer” options are disregarded as missing values. After the regressions are done the effects of the demographic variables on the given questions are presented in graphs – dots represent coefficients on the x axis, lines represent 95% confidence intervals on the x axis, variables are on the y axis (the categories presented in the graphs are compared to reference categories; reference categories are male for gender, primary education for education, in paid work for work, Central Hungary for region, capital for place of living, Fidesz for party preference), statistically significant effects differ from 0. For questions 4, 5, 6, 7 and 10 sub-questions are shown with different colors. R<sup>2</sup>-s and F-tests of the models are not presented, but based on the latter, all models used fit the data.

## Question 1

Question 1 was formulated as “What do you think, should Hungary remain the member of the European Union?” Figure 1 shows the distribution of the answers. A high majority (84.4%) of respondents agrees with the statement that Hungary should remain a member of the EU.

**Figure 1** – Answers to the question “What do you think, should Hungary remain the member of the European Union?”

After showing the general distribution, Table 1 depicts the relative frequencies across groups. Chi-square tests were run separately to analyze the relationship between the demographic characteristics and respondents’ opinions on whether Hungary should remain a member of the EU. The statistically significant relationships at a 95% confidence level are the following: education ( $\chi^2=23.480$ ;  $p<0.05$ ) and region ( $\chi^2=23.445$ ;  $p<0.05$ ). These are the demographic variables in which the distribution of the answers to Question 1 (whether Hungary should remain a member of the EU) differs across groups in the underlying population. By looking at the frequencies within the categories of these variables,<sup>6</sup> one can see that there are relatively more respondents who think that Hungary should remain a member of the EU within upper tier secondary, tertiary educational groups or within Central Hungary, Southern Transdanubia or Southern Great Plain regional groups than respondents with other educational or regional background – even though a majority in all those groups also thinks that Hungary should remain a member of the EU.

## Question 2

Question 2 was formulated as “What do you think, the picture drawn about the EU in the Hungarian political discourse is...” Figure 2 shows the distribution of the answers. The relative

---

<sup>6</sup> Since Question 1 is dichotomous (if the “do not know/no answer” is disregarded), here a comparison within demographic variables is done easily by comparing relative frequencies. As indicated before, for Questions 2-10 a different analysis is done to compare the answers of the different demographic groups.

majority (46.9%) of respondents agrees with the statement that the picture drawn about the EU in Hungary is too negative. The second most popular answer was that this picture is correct (29.0%).

**Figure 2** – Answers to the question “What do you think, the picture drawn about the EU in the Hungarian political discourse is...”

After showing the general distribution, Table 2 depicts the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 2 (about the picture drawn about the EU in the Hungarian political discourse) differs across groups in the underlying population:

- gender ( $\chi^2=10.523$ ;  $p<0.05$ ),
- age ( $\chi^2=44.861$ ;  $p<0.001$ ),
- education ( $\chi^2=26.862$ ;  $p<0.01$ ),
- work ( $\chi^2=85.408$ ;  $p<0.001$ ),
- place of living ( $\chi^2=31.576$ ;  $p<0.001$ )
- and party preference ( $\chi^2=92.904$ ;  $p<0.001$ ).

Figure 3 presents the effects of different demographic variables on Question 2 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- Those who still study think that the picture drawn about the EU in Hungary is too positive, compared to those currently working.
- DK, Momentum, LMP and Together voters think that this picture is unnecessarily negative compared to those preferring Fidesz.

Figure 3 – Effects of demographic variables on Question 2

### Question 3

Question 3 was formulated as “Do you agree with the following statement? The European Union treats Hungary in respectful manner.” Figure 4 shows the distribution of the answers. The relative majority (40.6%) of respondents rather agrees with the statement that Hungary is treated respectfully in the EU. If the relative frequencies of the negative and the positive answers are added up, it can be seen that an absolute majority (57.6%) thinks that Hungary is treated respectfully in the EU. Although it was asked differently, and there was a neutral answer option in Question 2, a comparison shows that while a majority thinks that Hungary is treated respectfully in the EU, a majority thinks that the EU is shown negatively in Hungarian politics.

Figure 4 – Answers to the question “Do you agree with the following statement? The European Union treats Hungary in respectful manner.”

After showing the general distribution, Table 3 depicts the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 3 (whether the EU treats Hungary in a respectful manner) differs across groups in the underlying population:

- age ( $\chi^2=39.169$ ;  $p<0.01$ ),
- education ( $\chi^2=22.191$ ;  $p<0.05$ ),
- work ( $\chi^2=48.057$ ;  $p<0.05$ ),
- region ( $\chi^2=71.731$ ;  $p<0.001$ )
- and party preference ( $\chi^2=145.388$ ;  $p<0.001$ ).

Figure 5 presents the effects of different demographic variables on Question 3 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- Respondents with upper tier secondary education agree less with the statement that Hungary is treated respectfully in the EU than those with primary education.
- Voters of all parties (except for Momentum) and non-voters agree more with the statement that Hungary is treated respectfully in the EU than Fidesz voters.

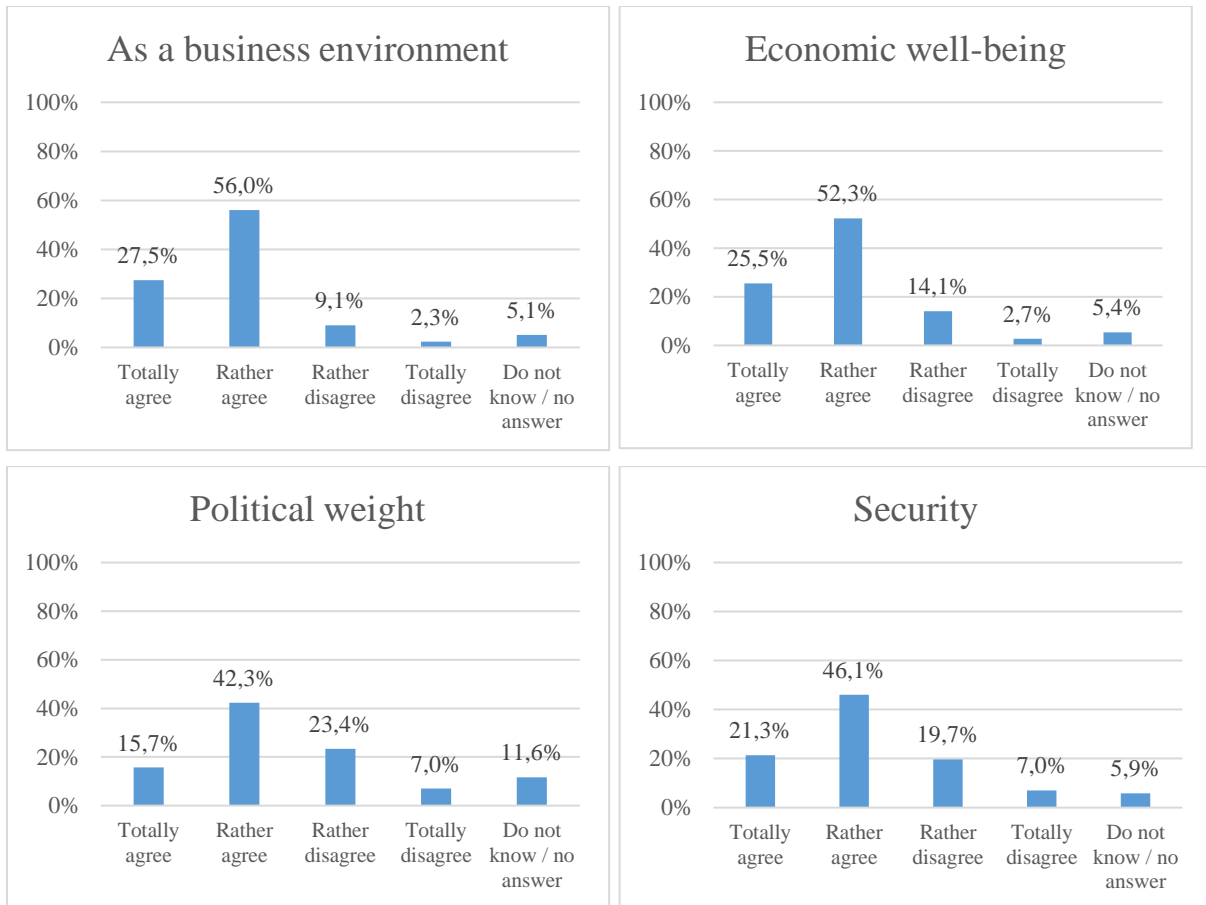

Figure 5 – Effects of demographic variables on Question 3

**Question 4**

Question 4 was formulated as “In your opinion being a member of the EU is rather an advantage or a disadvantage for Hungary?” Figure 6 shows the distribution of the answers to each sub-question. In two cases the absolute, in two cases the relative majority (respectively: 56.0%,

52.3%, 42.3%, 46.1%) of respondents rather agrees with the statements that the EU is rather an advantage for Hungary as a business environment, for its economic well-being, political weight and security. If the relative frequencies of the negative and the positive answers are added up, it can be seen that an absolute majority (respectively: 83.5%, 77.8%, 58%, 67.4%) thinks that the EU membership is an advantage for Hungary in all these aspects. Comparing the four different statements, one can say that rather the economic aspects of EU membership are perceived highly positively (business environment, economic well-being), even if the other two (political weight, security) are also viewed in a relatively positive way.

**Figure 6** – Answers to the question “In your opinion being a member of the EU is rather an advantage or a disadvantage for Hungary?”

After showing the general distributions, Tables 4a (business environment), 4b (economic well-being), 4c (political weight), 4d (security) depict the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 4 (whether being a member of the EU is an advantage or a disadvantage) differs across groups in the underlying population:

- in 4a:
  - gender ( $\chi^2=13.972$ ;  $p<0.01$ ),
  - education ( $\chi^2=32.372$ ;  $p<0.01$ )

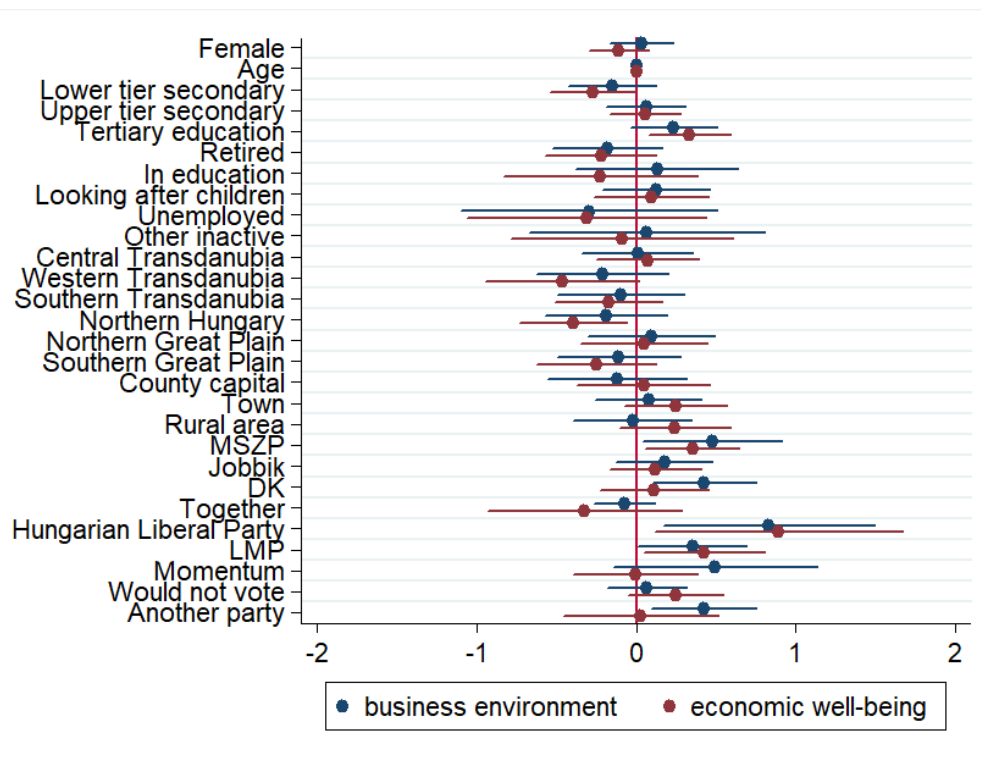

- and work ( $\chi^2=97.331$ ;  $p<0.001$ );
- in 4b:
  - gender ( $\chi^2=21.159$ ;  $p<0.001$ ),
  - age ( $\chi^2=30.136$ ;  $p<0.05$ ),
  - education ( $\chi^2=53.231$ ;  $p<0.001$ ),
  - work ( $\chi^2=127.431$ ;  $p<0.001$ )
  - and region ( $\chi^2=56.038$ ;  $p<0.001$ );
- in 4c:
  - gender ( $\chi^2=15.032$ ;  $p<0.01$ ),
  - age ( $\chi^2=45.581$ ;  $p<0.001$ ),
  - education ( $\chi^2=24.196$ ;  $p<0.05$ ),
  - work ( $\chi^2=79.990$ ;  $p<0.001$ ),
  - region ( $\chi^2=51.652$ ;  $p<0.01$ )
  - and party preference ( $\chi^2=93.899$ ;  $p<0.001$ );
- in 4d:
  - gender ( $\chi^2=23.738$ ;  $p<0.001$ ),
  - age ( $\chi^2=48.152$ ;  $p<0.001$ ),
  - education ( $\chi^2=26.360$ ;  $p<0.05$ ),
  - work ( $\chi^2=100.610$ ;  $p<0.001$ ),
  - region ( $\chi^2=51.917$ ;  $p<0.01$ )
  - and party preference ( $\chi^2=77.513$ ;  $p<0.01$ ).

Figure 7 presents the effects of different demographic variables on Question 4 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- MSZP, DK, HLP and LMP voters and voters of not listed parties agree more with the statement that the EU is beneficial for Hungary as a business environment than Fidesz voters.
- Respondents with tertiary education agree to a greater extent, while those with lower tier secondary education agree less with the statement that the EU is beneficial for Hungary for its economic well-being compared to those with primary education.
- Respondents from Northern Hungary agree less with the statement that the EU is beneficial for Hungary for its economic well-being compared to those from Central Hungary.
- MSZP, HLP and LMP voters agree more with the statement that the EU is beneficial for Hungary for its economic well-being than Fidesz voters.
- Respondents from Northern Hungary agree less with the statement that the EU is beneficial for Hungary for its political weight compared to those from Central Hungary.
- Together and HLP voters agree more, while Momentum voters agree less with the statement that the EU is beneficial for Hungary for its political weight than Fidesz voters.

- Older respondents agree less with the statement that being a member of the EU is beneficial for Hungary for its security.
- Respondents who are retired or look after children agree more, while those who still study agree less with the statement that the EU is beneficial for Hungary for its security compared to those in paid work.
- Respondents from Central Transdanubia agree more with the statement that the EU is beneficial for Hungary for its security compared to those from Central Hungary.
- DK, Together, HLP, LMP, Momentum voters and voters of not listed parties agree more with the statement that the EU is beneficial for Hungary for its security than Fidesz voters.

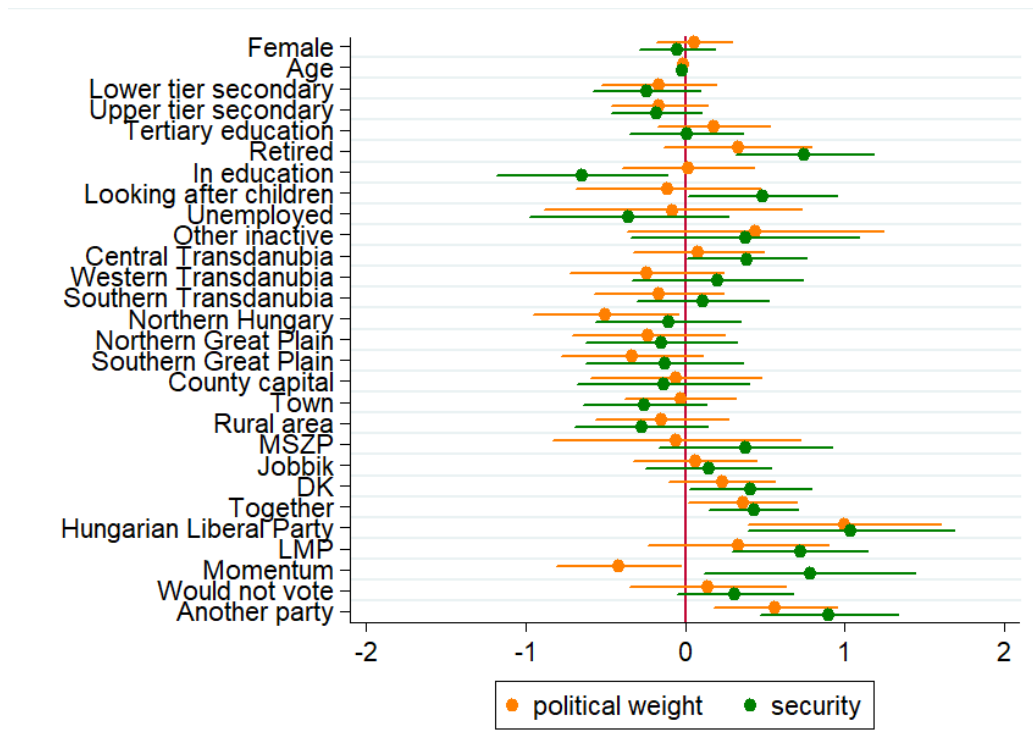

Figure 7 – Effects of demographic variables on Question 4

### Question 5

Question 5 was formulated as “In your opinion Hungary’s EU-related policies and decisions are rather an advantage or a disadvantage”. Figure 8 shows the distribution of the answers to each sub-question. In two cases the absolute, in two cases the relative majority (respectively: 52.8%, 55.6%, 41.9%, 50.7%) of respondents rather agrees with the statements that Hungary’s EU related policies are rather an advantage for the country as a business environment, for its economic well-being, political weight and security. If the relative frequencies of the negative and the positive answers are added up, it can be seen that an absolute majority (respectively: 68.9%, 71.5%, 53.6%, 66.0%) thinks that Hungary’s policies are an advantage for the country in all these aspects. Comparing the four different statements, one can say that rather the economic and security related aspects of Hungarian policies are perceived highly positively (business environment, economic well-being, security), even if their possible effects on political weight are also viewed in a relatively positive way. If we compare answers to Questions 4 and 5 in pairs (comparison is more understandable if we compute the means on a reversed scale where 0 means totally disagree and 3 means totally agree), perceived advantage coming from the EU is higher than that coming from Hungary’s policies (as a business environment: 2.15 versus 1.94; economic well-being: 2.06 versus 1.91; political weight: 1.75 versus 1.66; security: 1.87 versus 1.83) – it is also important to note that perceptions are better than neutral in all the cases.

**Figure 8** – Answers to the question “In your opinion Hungary's EU-related policies and decisions are rather an advantage or a disadvantage”

After showing the general distributions, Tables 5a (business environment), 5b (economic well-being), 5c (political weight), 5d (security) depict the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 5 (whether Hungary’s EU-related policies bring and advantage or a disadvantage) differs across groups in the underlying population:

- in 5a:
  - gender ( $\chi^2=12.595$ ;  $p<0.05$ ),
  - work ( $\chi^2=86.244$ ;  $p<0.001$ ),
  - place of living ( $\chi^2=21.919$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=69.675$ ;  $p<0.01$ );
- in 5b:
  - gender ( $\chi^2=15.789$ ;  $p<0.01$ ),
  - work ( $\chi^2=117.355$ ;  $p<0.001$ ),
  - region ( $\chi^2=64.507$ ;  $p<0.001$ )
  - and party preference ( $\chi^2=102.495$ ;  $p<0.001$ );
- in 5c:
  - gender ( $\chi^2=16.855$ ;  $p<0.01$ ),
  - age ( $\chi^2=37.875$ ;  $p<0.01$ ),

- work ( $\chi^2=82.812$ ;  $p<0.001$ )
- and party preference ( $\chi^2=80.786$ ;  $p<0.01$ );
- in 5d:
  - gender ( $\chi^2=10.132$ ;  $p<0.05$ ),
  - age ( $\chi^2=30.635$ ;  $p<0.05$ ),
  - education ( $\chi^2=23.961$ ;  $p<0.05$ )
  - and work ( $\chi^2=108.103$ ;  $p<0.001$ ).

Figure 9 presents the effects of different demographic variables on Question 5 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- Together and LMP voters agree less with the statement that Hungary's EU-related policies are beneficial for the country as a business environment than Fidesz voters.
- Respondents who still study agree less with the statement that Hungary's EU-related policies are beneficial for the country's economic well-being than those in paid work.
- Together voters and voters of not listed parties agree less, while non-voters agree more with the statement that Hungary's EU-related policies are beneficial for the country's economic well-being than Fidesz voters.
- Respondents with tertiary education agree less with the statement that Hungary's EU-related policies are beneficial for the country's political weight than those with primary education.
- Respondents who still study agree more with the statement that Hungary's EU-related policies are beneficial for the country's political weight than those in paid work.
- Non-voters agree more with the statement that Hungary's EU-related policies are beneficial for the country's political weight than Fidesz voters.
- Respondents with lower second tier, with upper second tier or with tertiary education all agree less with the statement that Hungary's EU-related policies are beneficial for the country's security than those with primary education.
- Respondents who are retired or look after children agree more with the statement that Hungary's EU-related policies are beneficial for the country's security than those in paid work.
- Respondents from Central Transdanubia agree more with the statement that Hungary's EU-related policies are beneficial for the country's security than those from Central Hungary.
- Non-voters agree more with the statement that Hungary's EU-related policies are beneficial for the country's security than Fidesz voters.

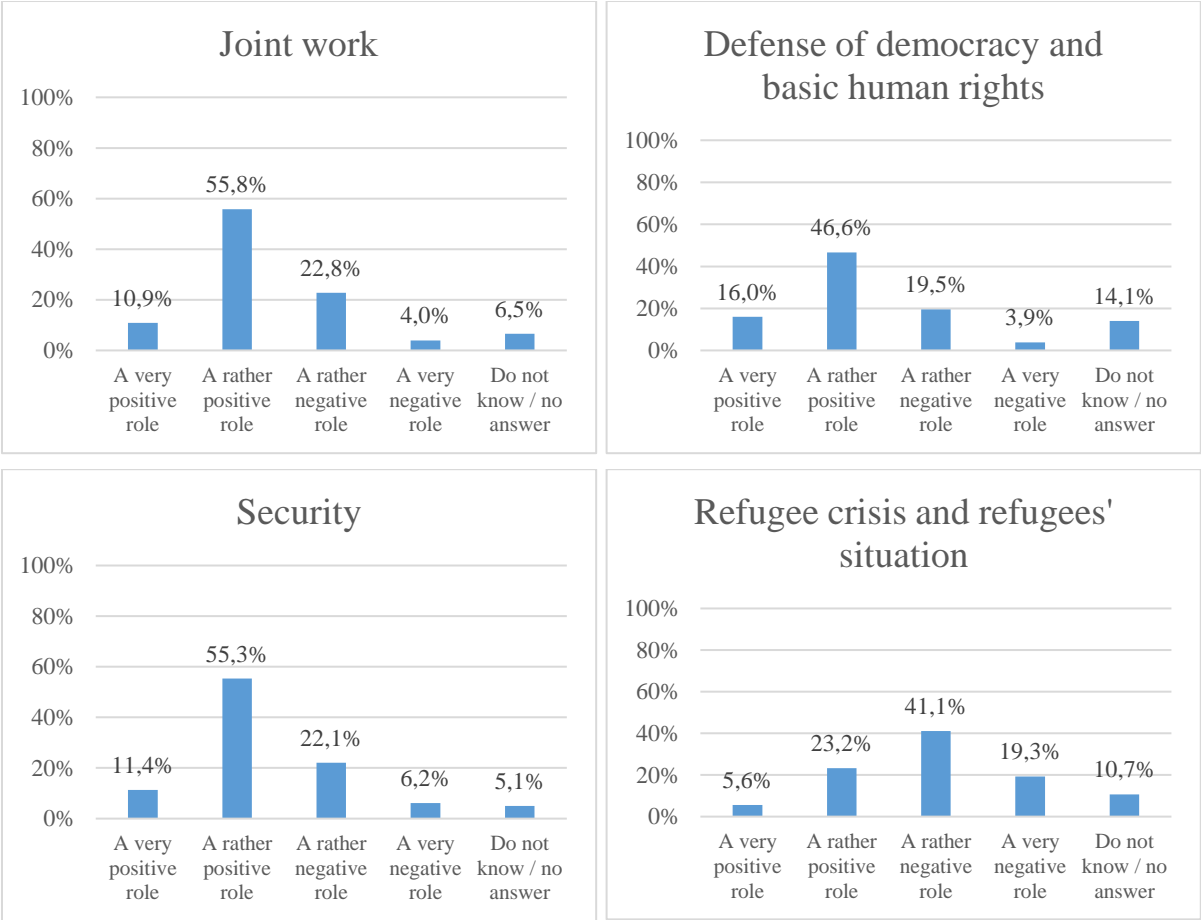

Figure 9 – Effects of demographic variables on Question 5

### Question 6

Question 6 was formulated as “In your opinion does the European Union play a rather positive or a rather negative role in the following areas?” Figure 10 shows the distribution of the answers to each sub-question. In two cases the absolute, in one case the relative majority (respectively:

55.8%, 46.6%, 55.3%) of respondents agrees with the statements that the EU plays a rather positive role in joint work between member states, in defense of democracy and human rights and in security. However a relative majority (41.1%) thinks that the EU plays a rather negative role in handling the refugee crisis and refugees' situation. If the relative frequencies of the negative and the positive answers are added up, it can be seen that an absolute majority (respectively: 66.7%, 62.6%, 66.7%) thinks that the EU plays a positive role in the first three areas, while an absolute majority (60.4%) thinks that the EU plays a negative role regarding the refugee crisis and refugees' situation.

**Figure 10** – Answers to the question “In your opinion does the European Union play a rather positive or a rather negative role in the following areas?”

After showing the general distributions, Tables 6a (joint work of member states), 6b (defense of democracy and basic human rights), 6c (security), 6d (refugee crisis and refugees' situation) depict the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 6 (whether the EU plays a positive or a negative role) differs across groups in the underlying population:

- in 6a:
  - age ( $\chi^2=27.991$ ;  $p<0.05$ ),

- work ( $\chi^2=87.284$ ;  $p<0.001$ ),
- region ( $\chi^2=49.284$ ;  $p<0.01$ )
- and party preference ( $\chi^2=81.142$ ;  $p<0.01$ );
- in 6b:
  - gender ( $\chi^2=13.178$ ;  $p<0.05$ ),
  - age ( $\chi^2=73.743$ ;  $p<0.001$ ),
  - education ( $\chi^2=42.572$ ;  $p<0.001$ ),
  - work ( $\chi^2=95.703$ ;  $p<0.001$ ),
  - region ( $\chi^2=45.255$ ;  $p<0.01$ ),
  - place of living ( $\chi^2=45.739$ ;  $p<0.001$ )
  - and party preference ( $\chi^2=91.690$ ;  $p<0.001$ );
- in 6c:
  - education ( $\chi^2=26.578$ ;  $p<0.01$ ),
  - work ( $\chi^2=145.881$ ;  $p<0.001$ ),
  - region ( $\chi^2=40.132$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=117.092$ ;  $p<0.001$ );
- in 6d:
  - work ( $\chi^2=99.932$ ;  $p<0.001$ ),
  - place of living ( $\chi^2=36.573$ ;  $p<0.001$ )
  - and party preference ( $\chi^2=126.312$ ;  $p<0.001$ ).

Figure 11 presents the effects of different demographic variables on Question 6 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- Older respondents agree less with the statement that the EU plays a positive role in joint work between member states.
- Respondents from rural areas agree less with the statement that the EU plays a positive role in joint work between member states than those from the capital.
- MSZP, DK, Together, HLP, LMP voters and voters of not listed parties agree more with the statement that the EU plays a positive role in joint work between member states than Fidesz voters.
- Older respondents agree less with the statement that the EU plays a positive role in the defense of democracy and basic human rights.
- Respondents from Western Transdanubia agree more with the statement that the EU plays a positive role in the defense of democracy and basic human rights than those from Central Hungary.
- Respondents from rural areas agree less with the statement that the EU plays a positive role in the defense of democracy and basic human rights than those from the capital.
- MSZP, DK, HLP, LMP voters, non-voters and voters of not listed parties agree more with the statement that the EU plays a positive role in the defense of democracy and basic human rights than Fidesz voters.
- Older respondents agree less with the statement that the EU plays a positive role in security.

- Respondents who are retired, look after children or are other inactive agree more with the statement that the EU plays a positive role in security than those in paid work.
- MSZP, DK, HLP voters and voters of not listed parties agree more with the statement that the EU plays a positive role in security than Fidesz voters.
- Respondents who still study or are currently unemployed agree less with the statement that the EU plays a positive role in handling the refugee crisis than those in paid work.
- DK, HLP, LMP voters, non-voters and voters of not listed parties agree more with the statement that the EU plays a positive role in handling the refugee crisis than Fidesz voters.

Figure 11 – Effects of demographic variables on Question 6

### Question 7

Question 7 was formulated as “In your opinion does Hungary play a rather positive or a rather negative role in the following areas?” Figure 12 shows the distribution of the answers to each sub-question. In three cases the absolute majority (respectively: 54.8%, 50.6%, 55.9%) of

respondents agrees with the statements that Hungary plays a rather positive role in joint work between member states, in defense of democracy and basic human rights and in security. However a relative majority (35.4%) thinks that Hungary plays a rather negative role in handling the refugee crisis and refugees' situation. If the relative frequencies of the negative and the positive answers are added up, it can be seen that an absolute majority (respectively: 64.7%, 60.6%, 72.1%) thinks that Hungary plays a positive role in the first three areas, while an absolute majority (54.2%) thinks that Hungary plays a negative role regarding the refugee crisis. If we compare answers to Questions 6 and 7 in pairs (on a reversed 0-3 scale, where a higher value is a more positive perception), a more positive role is perceived of the EU in two cases (joint work or solidarity with other member states: 1.79 versus 1.74; defense of democracy: 1.87 versus 1.67), while a more positive role is perceived of Hungary in the two other fields (security: 1.76 versus 1.92; refugee crisis and refugees' situation: 1.17 versus 1.30).

**Figure 12** – Answers to the question “In your opinion does Hungary play a rather positive or a rather negative role in the following areas?”

After showing the general distributions, Tables 7a (solidarity with other member states), 7b (defense of democracy and basic human rights), 7c (security), 7d (refugee crisis and refugees' situation) depict the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the

demographic variables in which the distribution of the answers to Question 7 (whether Hungary plays a positive or a negative role) differs across groups in the underlying population:

- in 7a:
  - gender ( $\chi^2=12.316$ ;  $p<0.05$ ),
  - age ( $\chi^2=29.075$ ;  $p<0.05$ ),
  - education ( $\chi^2=27.196$ ;  $p<0.01$ ),
  - work ( $\chi^2=138.750$ ;  $p<0.001$ ),
  - region ( $\chi^2=41.431$ ;  $p<0.05$ ),
  - place of living ( $\chi^2=24.122$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=116.959$ ;  $p<0.001$ );
- in 7b:
  - gender ( $\chi^2=11.182$ ;  $p<0.05$ ),
  - age ( $\chi^2=55.971$ ;  $p<0.001$ ),
  - education ( $\chi^2=38.484$ ;  $p<0.001$ ),
  - work ( $\chi^2=141.121$ ;  $p<0.001$ ),
  - region ( $\chi^2=39.344$ ;  $p<0.05$ ),
  - place of living ( $\chi^2=25.393$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=138.382$ ;  $p<0.001$ );
- in 7c:
  - gender ( $\chi^2=12.525$ ;  $p<0.05$ ),
  - age ( $\chi^2=31.846$ ;  $p<0.05$ ),
  - work ( $\chi^2=143.521$ ;  $p<0.001$ ),
  - place of living ( $\chi^2=41.126$ ;  $p<0.001$ )
  - and party preference ( $\chi^2=75.129$ ;  $p<0.01$ );
- in 7d:
  - gender ( $\chi^2=15.724$ ;  $p<0.01$ ),
  - age ( $\chi^2=27.411$ ;  $p<0.05$ ),
  - work ( $\chi^2=119.947$ ;  $p<0.001$ ),
  - place of living ( $\chi^2=22.091$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=94.599$ ;  $p<0.001$ ).

Figure 13 presents the effects of different demographic variables on Question 7 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- Respondents with tertiary education agree less with the statement that Hungary plays a positive role in solidarity between member states than those with primary education.
- Respondents who are unemployed agree more with the statement that Hungary plays a positive role in solidarity between member states than those in paid work.
- Jobbik, DK, HLP, LMP voters, non-voters and voters of not listed parties agree less with the statement that Hungary plays a positive role in solidarity between member states than Fidesz voters.

- Respondents who are unemployed agree more with the statement that Hungary plays a positive role in the defense of democracy and basic human rights than those in paid work.
- MSZP, Jobbik, DK, HLP, Momentum voters and voters of not listed parties agree less with the statement that Hungary plays a positive role in the defense of democracy and basic human rights than Fidesz voters.
- Respondents from Northern Hungary agree more with the statement that Hungary plays a positive role in security than those from Central Hungary.
- Jobbik voters and voters of not listed parties agree less with the statement that Hungary plays a positive role in security than Fidesz voters.
- Respondents with upper tier secondary education agree more with the statement that Hungary plays a positive role in handling the refugee crisis than those with a tertiary education.
- Respondents who are retired agree less, while those who are unemployed agree more with the statement that Hungary plays a positive role in handling the refugee crisis than those in paid work.
- MSZP, Jobbik, Together, HLP, Momentum voters and voters of not listed parties agree less with the statement that Hungary plays a positive role in handling the refugee crisis than Fidesz voters.

Figure 13 – Effects of demographic variables on Question 7

### Question 8

Question 8 was formulated as “Do you agree with the following statement? European Union is often used as a scapegoat by our politicians to cover their mistakes.” Figure 14 shows the distribution of the answers. The relative majority (41.5%) of respondents totally agrees with the

statement that the picture drawn about the EU is often used a scapegoat in Hungary – and 68.3% agrees with the statement to some extent.

**Figure 14** – Answers to the question “Do you agree with the following statement? European Union is often used as a scapegoat by our politicians to cover their mistakes.”

After showing the general distribution, Table 8 depicts the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 8 (whether the EU is used as a scapegoat in Hungary) differs across groups in the underlying population.

- age ( $\chi^2=29.888$ ;  $p<0.05$ ),
- work ( $\chi^2=127.185$ ;  $p<0.001$ ),
- region ( $\chi^2=48.343$ ;  $p<0.01$ ),
- place of living ( $\chi^2=22.375$ ;  $p<0.05$ )
- and party preference ( $\chi^2=128.805$ ;  $p<0.001$ ).

Figure 15 presents the effects of different demographic variables on Question 8 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- Respondents from towns agree less with the statement that the EU is used as a scapegoat by Hungarian politicians than those from the capital.
- Voters of all parties (except for HLP) and non-voters agree more with the statement that the EU is used as a scapegoat by Hungarian politicians than Fidesz voters.

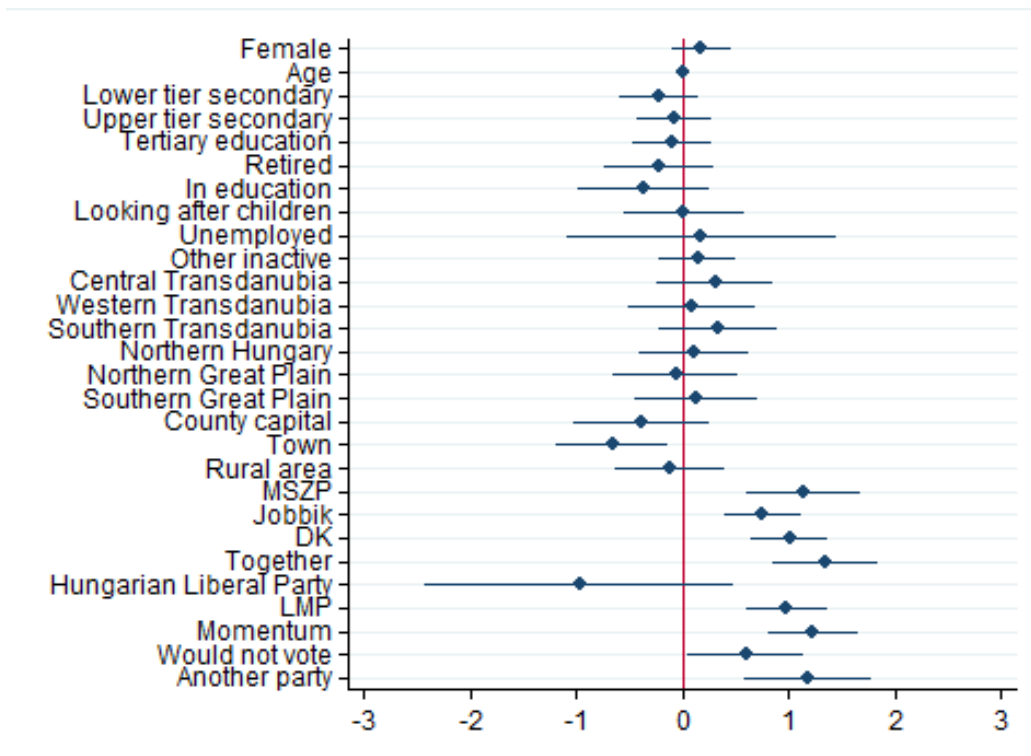

Figure 15 – Effects of demographic variables on Question 8

### Question 9

Question 9 was formulated as “Do you agree with the following statement? There is a huge gap between citizens' and political elites' views/attitudes.” Figure 16 shows the distribution of the answers. The relative majority (46.0%) of respondents totally agrees with the statement that there is a huge gap between citizens’ and elites’ attitudes – and 74.0% agrees with the statement to some extent.

Figure 16 – Answers to the question “Do you agree with the following statement? There is a huge gap between citizens' and political elites' views/attitudes.”

After showing the general distribution, Table 9 depicts the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 9 (whether there is a huge gap between citizens' and political elites' views/attitudes) differs across groups in the underlying population:

- gender ( $\chi^2=11.785$ ;  $p<0.05$ ),
- age ( $\chi^2=36.303$ ;  $p<0.01$ ),
- work ( $\chi^2=169.026$ ;  $p<0.001$ ),
- region ( $\chi^2=43.683$ ;  $p<0.01$ )
- and party preference ( $\chi^2=131.072$ ;  $p<0.001$ ).

Figure 17 presents the effects of different demographic variables on Question 9 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- Older respondents agree less with the statement that there is a gap between political elites' and citizens' views.
- Voters of all parties agree more with the statement that there is a gap between political elites' and citizens' views than Fidesz voters.

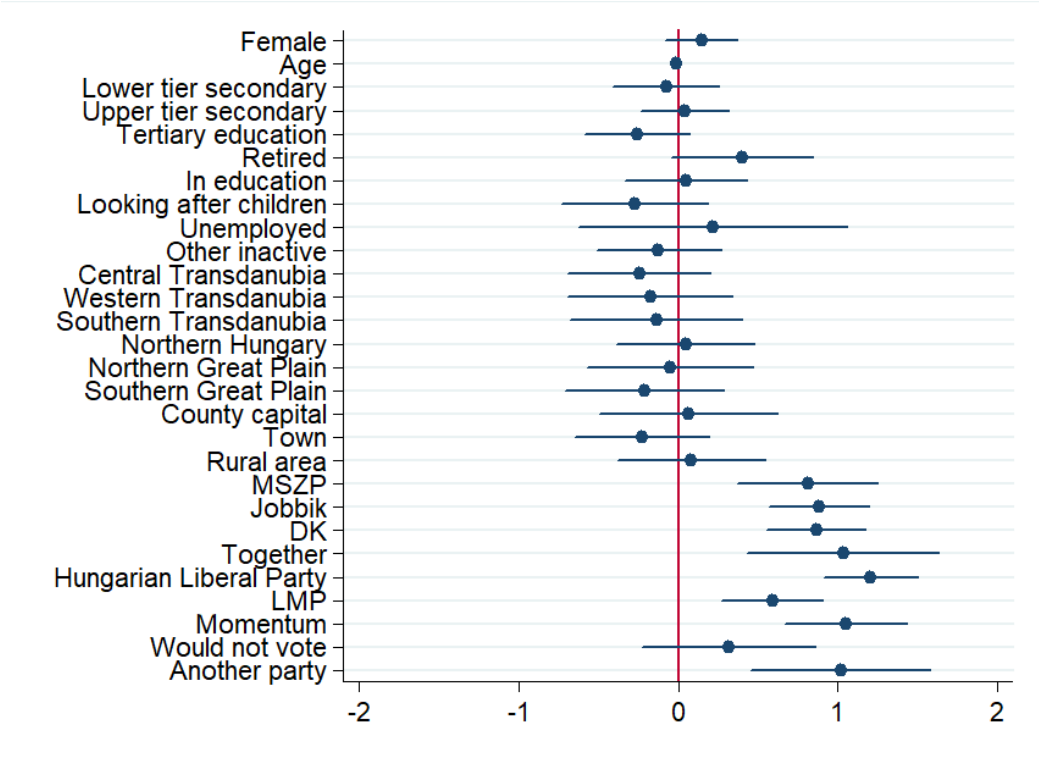

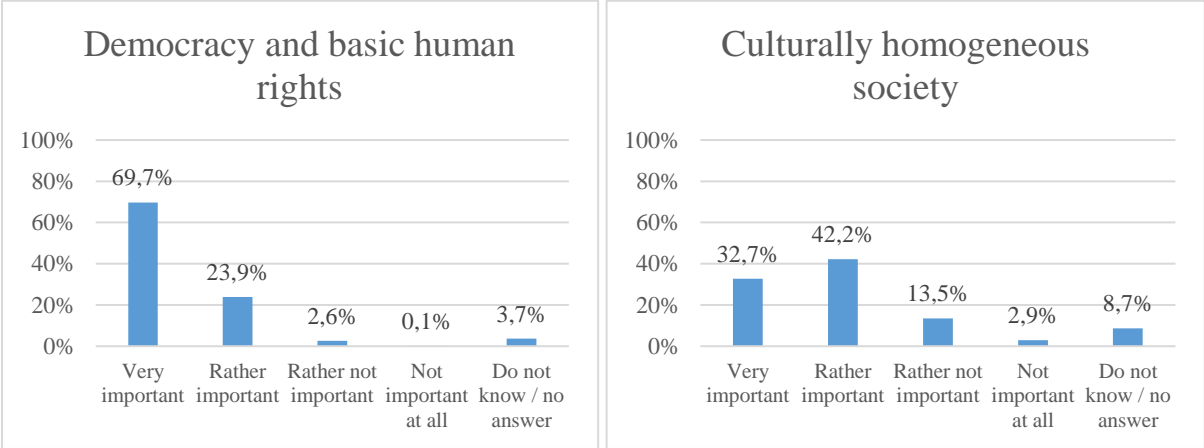

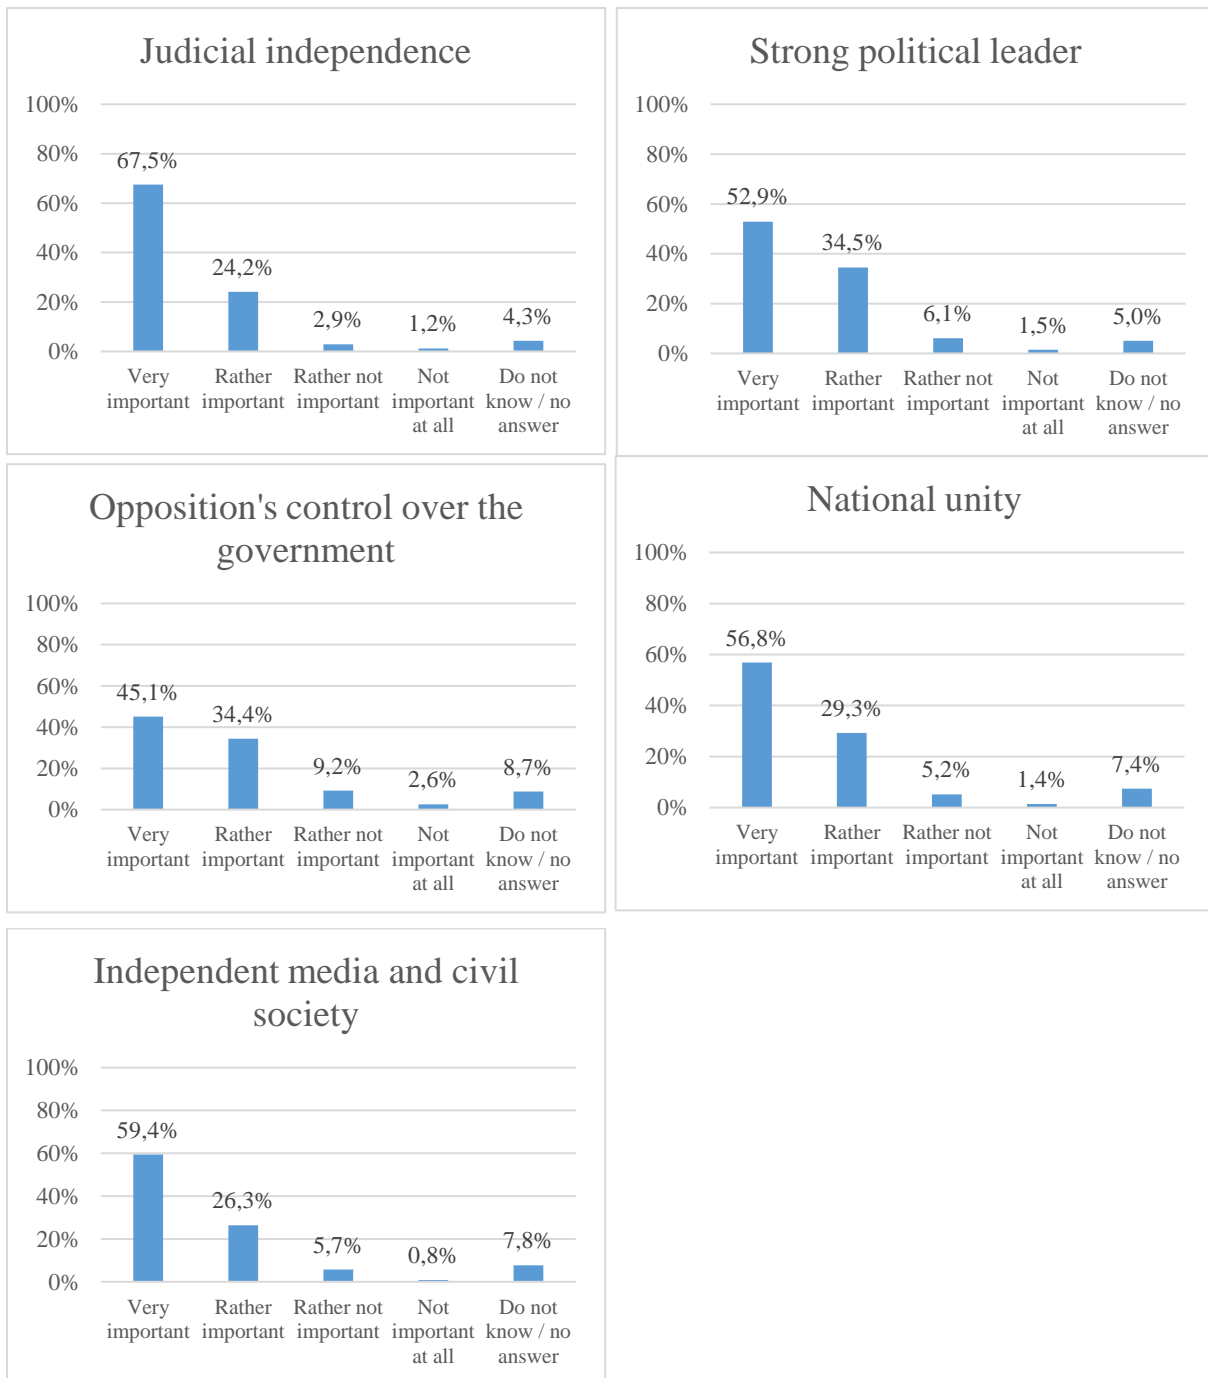

Figure 17 – Effects of demographic variables on Question 9

**Question 10**

Question 10 was formulated as “Personally, how important are these issues to you?” Figure 18 shows the distribution of the answers to each sub-question. In five cases the absolute, in one case the relative majority (respectively: 69.7%, 67.5%, 52.9%, 45.1%, 56.8%, 59.4%) of respondents thinks that democracy and basic human rights, judicial independence, a strong political leader, opposition’s control over government, national unity and an independent media and civil society are very important for them, while a relative majority (42.2%) of the respondents think that a culturally homogeneous society is rather important for them. If the relative frequencies of the answers are added up, it can be seen that an absolute majority (respectively: 93.6%, 74.9%, 91.7%, 87.4%, 79.5%, 86.1%, 85.7%) thinks that these issues are important for them.

**Figure 18** – Answers to the question “Personally, how important are these issues to you?”

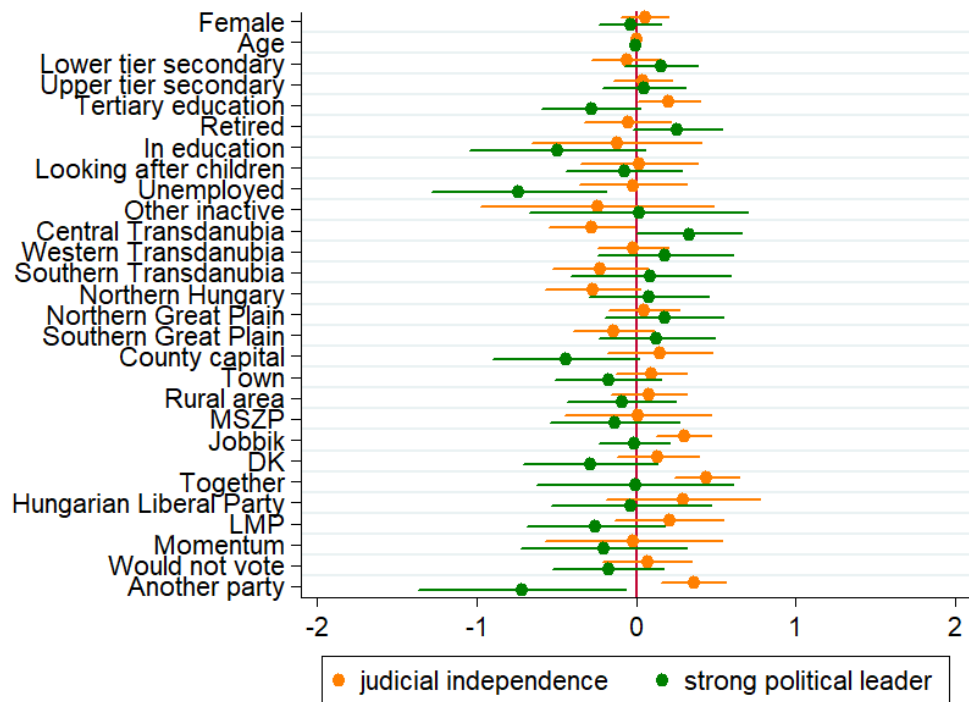

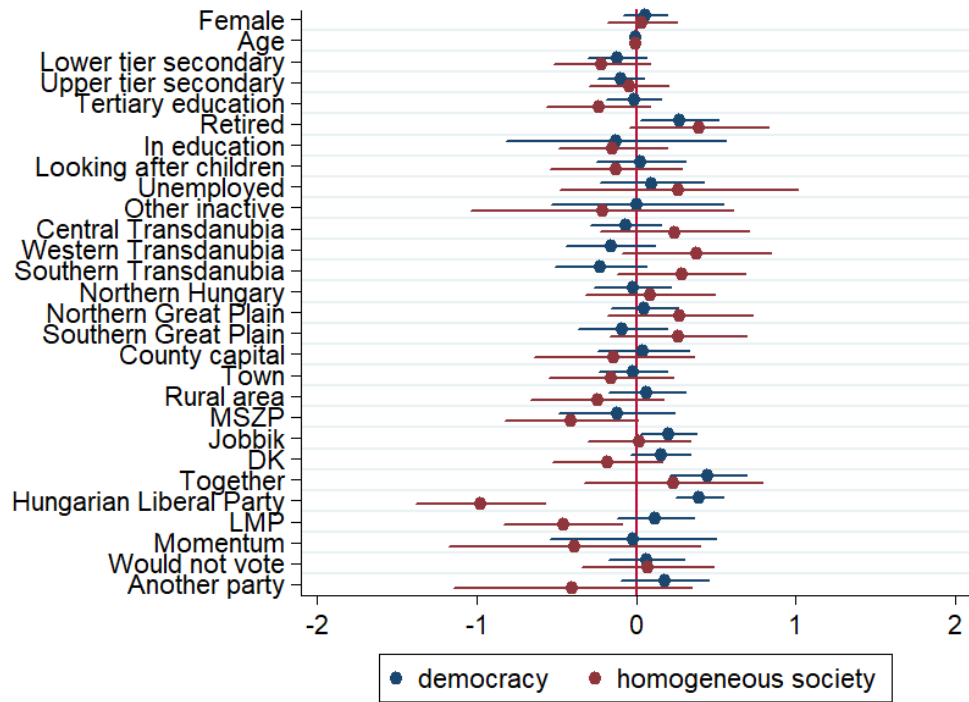

After showing the general distributions, Tables 10a (democracy and basic human rights), 10b (culturally homogeneous society), 10c (judicial independence), 10d (strong political leader), 10e (opposition's control over the government), 10f (national unity), 10g (independent media and civil society) depict the relative frequencies across groups. By using chi-square tests, the statistically significant relationships at a 95% confidence level are the following. These are the demographic variables in which the distribution of the answers to Question 10 (on the importance of different listed issues) differs across groups in the underlying population.

- in 10a:
  - gender ( $\chi^2=16.246$ ;  $p<0.01$ ),
  - education ( $\chi^2=22.904$ ;  $p<0.05$ ),
  - work ( $\chi^2=302.866$ ;  $p<0.001$ ),
  - region ( $\chi^2=37.985$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=75.966$ ;  $p<0.01$ );
- in 10b:
  - gender ( $\chi^2=17.621$ ;  $p<0.01$ ),
  - age ( $\chi^2=44.216$ ;  $p<0.001$ ),
  - education ( $\chi^2=38.593$ ;  $p<0.001$ ),
  - work ( $\chi^2=157.112$ ;  $p<0.001$ ),
  - region ( $\chi^2=37.553$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=83.425$ ;  $p<0.001$ );
- in 10c:
  - gender ( $\chi^2=13.521$ ;  $p<0.01$ ),
  - age ( $\chi^2=40.144$ ;  $p<0.01$ ),
  - education ( $\chi^2=50.312$ ;  $p<0.001$ ),
  - work ( $\chi^2=285.443$ ;  $p<0.001$ ),
  - region ( $\chi^2=46.883$ ;  $p<0.01$ ),
  - place of living ( $\chi^2=25.165$ ;  $p<0.05$ )
  - and party preference ( $\chi^2=69.935$ ;  $p<0.01$ );
- in 10d:
  - education ( $\chi^2=27.294$ ;  $p<0.01$ ),
  - work ( $\chi^2=256.633$ ;  $p<0.001$ )
  - and party preference ( $\chi^2=92.856$ ;  $p<0.001$ );
- in 10e:
  - gender ( $\chi^2=9.788$ ;  $p<0.05$ ),
  - age ( $\chi^2=60.766$ ;  $p<0.001$ ),
  - education ( $\chi^2=25.873$ ;  $p<0.05$ ),
  - work ( $\chi^2=165.699$ ;  $p<0.001$ ),
  - region ( $\chi^2=39.036$ ;  $p<0.05$ ),
  - place of living ( $\chi^2=36.808$ ;  $p<0.001$ )
  - and party preference ( $\chi^2=100.558$ ;  $p<0.001$ );
- in 10f:
  - gender ( $\chi^2=22.208$ ;  $p<0.001$ ),
  - age ( $\chi^2=40.875$ ;  $p<0.01$ ),
  - education ( $\chi^2=31.896$ ;  $p<0.01$ ),
  - work ( $\chi^2=164.743$ ;  $p<0.001$ ),
  - region ( $\chi^2=36.547$ ;  $p<0.05$ ),
  - place of living ( $\chi^2=35.131$ ;  $p<0.001$ )
  - and party preference ( $\chi^2=101.981$ ;  $p<0.001$ );
- in 10g:
  - gender ( $\chi^2=11.449$ ;  $p<0.05$ ),

- age ( $\chi^2=57.462$ ;  $p<0.001$ ),
- education ( $\chi^2=39.891$ ;  $p<0.001$ ),
- work ( $\chi^2=190.742$ ;  $p<0.001$ ),
- place of living ( $\chi^2=39.481$ ;  $p<0.001$ )
- and party preference ( $\chi^2=74.382$ ;  $p<0.01$ ).

Figure 19 presents the effects of different demographic variables on Question 10 - when effects of other variables are also controlled for. Only the significant effects are discussed here (for the interpretation of the graph, see note 5 on methodology).

- For respondents who are retired, democracy is more important than for those in paid work.
- For Jobbik, Together and HLP voters, democracy is more important than for Fidesz voters.
- For HLP and LMP voters, a culturally homogeneous society is less important than for Fidesz voters.
- For respondents with tertiary education, judicial independence is more important than for those with primary education.
- For respondents from Central Transdanubia, judicial independence is less important than for those from Central Hungary.
- For Jobbik, Together voters and for voters of not listed parties, judicial independence is more important than for Fidesz voters.
- For respondents who are unemployed, a strong leader is less important than for those in paid work.
- For voters of not listed parties, a strong leader is less important than for Fidesz voters.
- For older respondents, opposition's control is more important.
- For respondents who are retired, opposition's control is less important, while for those who still study or are other inactive, it is more important than for those in paid work.
- For Jobbik, DK, Together, HLP, LMP voters and for non-voters, opposition's control is more important than for Fidesz voters.
- For respondents who are retired, national unity is more important, while for those who still study, it is less important than for those in paid work.
- For voters of not listed parties, national unity is less important than for Fidesz voters.
- For respondents who still study, independent media and civil society is less important than for those in paid work.
- For MSZP, Jobbik, DK, HLP, LMP voters and for non-voters, independent media and civil society is more important than for Fidesz voters.

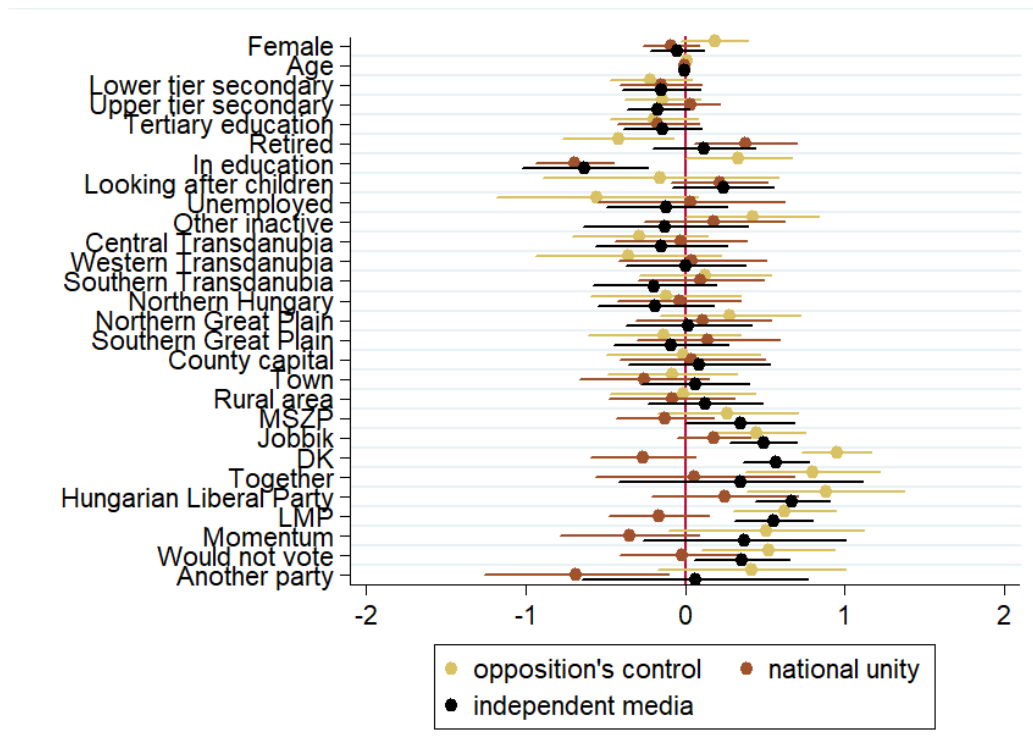

Figure 19 – Effects of demographic variables on Question 10

## Conclusion

The EU-related results of this report may be summarized with three statements. First, the EU is regarded positively in Hungary: 1, Hungarian citizens think that we should remain a member of the EU (Question 1); 2, the EU is respectful with Hungary (Question 3); 3, the EU is beneficial for Hungary in many aspects (Question 4); 4, and plays a positive role in many areas (Question 6). The only exception to the general positive image of the EU is how Hungarians perceive its role in handling the refugee crisis (Question 6d).

Second, Hungarian citizens think that the EU is not treated as it should be by Hungarian politicians: 1, the picture drawn of the EU is too negative in the political discourse (Question 2); 2, and it is often used as a scapegoat by Hungarian politicians to cover their mistakes (Question 8).

Finally, it can be seen from the analyses conducted, that although there are some differences across demographic groups both in perceptions of the EU and in perceived treatment of the EU by Hungarian politicians, the main differences are across party preference lines: Fidesz voters and voters of the other parties (together with non-voters) differ a lot in their answers to many of the EU-related questions – even if not in all of them and even if Fidesz voters are positive about the EU in many aspects.
